Probabilistic Independence

Probabilistic Independence

Definition: random variables X, Y independent iff,

$$\mathbb{P}(X, Y) = \mathbb{P}(X) \cdot \mathbb{P}(Y).$$

Probabilistic Independence

Definition: random variables X, Y independent iff,

$$\mathbb{P}(X, Y) = \mathbb{P}(X) \cdot \mathbb{P}(Y).$$

Intuition: the value of one variable does not give information about the other.

Probabilistic Independence

Definition: random variables X, Y independent iff,

$$\mathbb{P}(X, Y) = \mathbb{P}(X) \cdot \mathbb{P}(Y).$$

Intuition: the value of one variable does not give information about the other.

Example:

Probabilistic Independence

Definition: random variables X, Y independent iff,

$$\mathbb{P}(X, Y) = \mathbb{P}(X) \cdot \mathbb{P}(Y).$$

Intuition: the value of one variable does not give information about the other.

Example:

$X \sim$ 

Probabilistic Independence

Definition: random variables X, Y independent iff,

$$\mathbb{P}(X, Y) = \mathbb{P}(X) \cdot \mathbb{P}(Y).$$

Intuition: the value of one variable does not give information about the other.

Example:

$X \sim$  $Y \sim$ 

Motivating Example

How to we ensure the security of an encryption algorithm?

Motivating Example

How to we ensure the security of an encryption algorithm?

Encode 

as probabilistic programs;

Motivating Example

How to we ensure the security of an encryption algorithm?

Encode  as probabilistic programs;

Verify  are probabilistically independent.

Motivating Example

How to we ensure the security of an encryption algorithm?

Encode  as probabilistic programs;

However, reasoning about probabilities can be hard.

Verify  are probabilistically independent.

My Goal

Design formal methods to reason about independence and dependencies in the distribution constructed by probabilistic programs.

Why Formal Methods

Why Formal Methods

Rigorous: unlike documentations in natural languages, formal specifications have **no vagueness** and can **capture target properties exactly**.

Why Formal Methods

Rigorous: unlike documentations in natural languages, formal specifications have **no vagueness** and can **capture target properties exactly**.

Axiomatic: a set of axioms and rules that a computer can follow, e.g. program logic, type systems.

Why Formal Methods and Which Kind?

Rigorous: unlike documentations in natural languages, formal specifications have **no vagueness** and can **capture target properties exactly**.

Axiomatic: a set of axioms and rules that a computer can follow, e.g. program logic, type systems.

Why Formal Methods and Which Kind?

Rigorous: unlike documentations in natural languages, formal specifications have **no vagueness** and can **capture target properties exactly**.

Axiomatic: a set of axioms and rules that a computer can follow, e.g. program logic, type systems.

Want relative simplicity:

Why Formal Methods and Which Kind?

Rigorous: unlike documentations in natural languages, formal specifications have **no vagueness** and can **capture target properties exactly**.

Axiomatic: a set of axioms and rules that a computer can follow, e.g. program logic, type systems.

Want relative simplicity:

Require less human ingenuity or human time.

Why Formal Methods and Which Kind?

Rigorous: unlike documentations in natural languages, formal specifications have **no vagueness** and can **capture target properties exactly**.

Axiomatic: a set of axioms and rules that a computer can follow, e.g. program logic, type systems.

Want relative simplicity:

Require less human ingenuity or human time.

Match better with pen-and-paper proofs.

Probabilistic (In)dependencies

Formally Reasoning about Conditional Independence

Conditional Independence

Conditional Independence

Intuition: the value of X does not give information about the value of Y if we already know the value of Z.

Conditional Independence

Intuition: the value of X does not give information about the value of Y if we already know the value of Z.

Definition: Variables X, Y are conditionally independent given Z iff,

$$\mathbb{P}(X, Y \mid Z) = \mathbb{P}(X \mid Z) \cdot \mathbb{P}(Y \mid Z).$$

Conditional Independence

Intuition: the value of X does not give information about the value of Y if we already know the value of Z.

Definition: Variables X, Y are conditionally independent given Z iff,

$$\mathbb{P}(X, Y \mid Z) = \mathbb{P}(X \mid Z) \cdot \mathbb{P}(Y \mid Z).$$

Example: ice cream sales and sunglasses sales

Conditional Independence

Intuition: the value of X does not give information about the value of Y if we already know the value of Z.

Definition: Variables X, Y are conditionally independent given Z iff,

$$\mathbb{P}(X, Y \mid Z) = \mathbb{P}(X \mid Z) \cdot \mathbb{P}(Y \mid Z).$$

Example: ice cream sales and sunglasses sales

sunny $\sim$ 

if sunny:

Conditional Independence

Intuition: the value of X does not give information about the value of Y if we already know the value of Z.

Definition: Variables X, Y are conditionally independent given Z iff,

$$\mathbb{P}(X, Y \mid Z) = \mathbb{P}(X \mid Z) \cdot \mathbb{P}(Y \mid Z).$$

Example: ice cream sales and sunglasses sales

sunny ~ 

if sunny:

buy  ~ 

Conditional Independence

Intuition: the value of X does not give information about the value of Y if we already know the value of Z.

Definition: Variables X, Y are conditionally independent given Z iff,

buy  ~ 

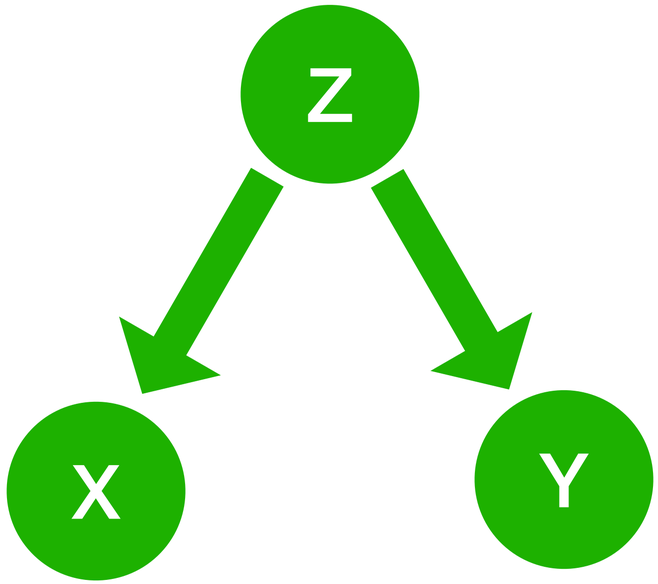
Applications of Conditional Independence

Applications of Conditional Independence

- Represent and transform a joint distribution more efficiently.

Applications of Conditional Independence

- Represent and transform a joint distribution more efficiently.



Our Goal

Our Goal

Design a program logic for proving conditional independence (CI)

Our Goal

Design a program logic for proving conditional independence (CI)

Example:

```
sunny := coin()
if sunny:
   icecream := coin();
   sunglasses := coin();
else:
   icecream := False;
   sunglasses := False;
```

Our Goal

Design a program logic for proving conditional independence (CI)

Example: **Precondition:** { ⊤ }

```
sunny := coin()
if sunny:
   icecream := coin();
   sunglasses := coin();
else:
   icecream := False;
   sunglasses := False;
```

Post-condition: {icecream, sunglasses **are CI given** sunny}

Our Goal

Design a program logic for proving conditional independence (CI)

Example: **Precondition:** { ⊤ }

```
sunny := coin()
if sunny:
   icecream := coin();
   sunglasses := coin();
else:
   icecream := False;
   sunglasses := False;
```

- How to express CI as assertions?
- How to prove CI in programs?

Post-condition: {icecream, sunglasses **are CI given** sunny}

A BI model for Independence [Barthe et al. 2020]

Kripke Semantics Definition

A BI model for Independence [Barthe et al. 2020]

Kripke Semantics Definition

Let states be $\mathscr{D}$Mem.

A BI model for Independence [Barthe et al. 2020]

Kripke Semantics Definition

Let states be $\mathscr{D}$Mem.

$\mu \vDash P * Q$ iff there exist μ_1, μ_2 such that $\mu_1 \vDash P, \mu_2 \vDash Q$ and $\mu_1 \oplus \mu_2 = \mu$,

where $\oplus$ takes the **independent product** of two distributions.

A BI model for Independence [Barthe et al. 2020]

Kripke Semantics Definition

Let states be $\mathscr{D}\mathsf{Mem}$.

$\mu \vDash P * Q$ iff there exist μ_1, μ_2 such that $\mu_1 \vDash P, \mu_2 \vDash Q$ and $\mu_1 \oplus \mu_2 = \mu$,
where $\oplus$ takes the **independent product** of two distributions.

$\mu \vDash \langle X \rangle$ iff there exists S such that $\mu \in \mathscr{D}[S]$ and $X \in S$.

A BI model for Independence [Barthe et al. 2020]

Kripke Semantics Definition

Let states be $\mathscr{D}\mathsf{Mem}$.

$\mu \vDash P * Q$ iff there exist μ_1, μ_2 such that $\mu_1 \vDash P, \mu_2 \vDash Q$ and $\mu_1 \oplus \mu_2 = \mu$,
where $\oplus$ takes the **independent product** of two distributions.

$\mu \vDash \langle X \rangle$ iff there exists S such that $\mu \in \mathscr{D}[S]$ and $X \in S$.

Theorem

$\mu \vDash \langle X \rangle * \langle Y \rangle$ iff X, Y are independent in μ.

A BI model for Independence [Barthe et al. 2020]

Kripke Semantics Definition

Let states be $\mathscr{D}\mathsf{Mem}$.

$\mu \vDash P * Q$ iff there exist μ_1, μ_2 such that $\mu_1 \vDash P, \mu_2 \vDash Q$ and $\mu_1 \oplus \mu_2 = \mu$,
where $\oplus$ takes the **independent product** of two distributions.

$\mu \vDash \langle X \rangle$ iff there exists S such that $\mu \in \mathscr{D}[S]$ and $X \in S$.

Theorem

$\mu \vDash \langle X \rangle * \langle Y \rangle$ iff X, Y are independent in μ.

How do we adapt this logic for capturing conditional independence?

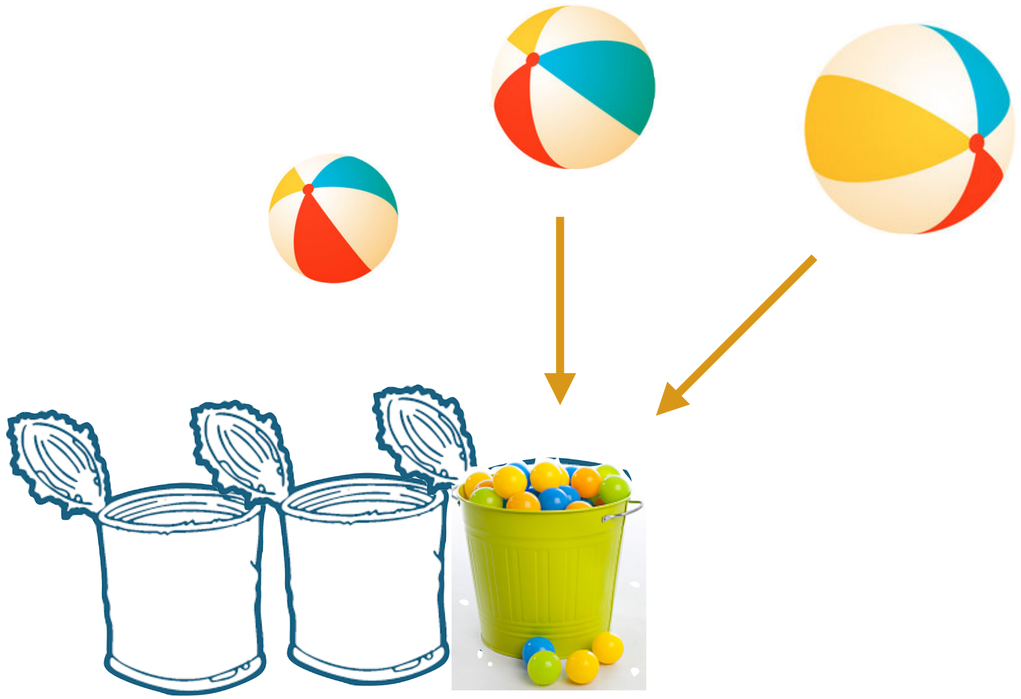
Not Independent!

Concentration bounds:

$$Y = \sum_{i}^{n} Y_i \text{, where } Y_i \text{ are independent}$$

$$\mathbb{P}[\,|\,Y - \mathbb{E}[Y]\,|\,\geq M] \leq f(n, M)$$

Motivating Example: Balls-into-Bins



$$\mathbb{P}\left[\sum_{bin} \text{overflow}[bin] \geq 2\right] \leq ?$$

Not Independent!

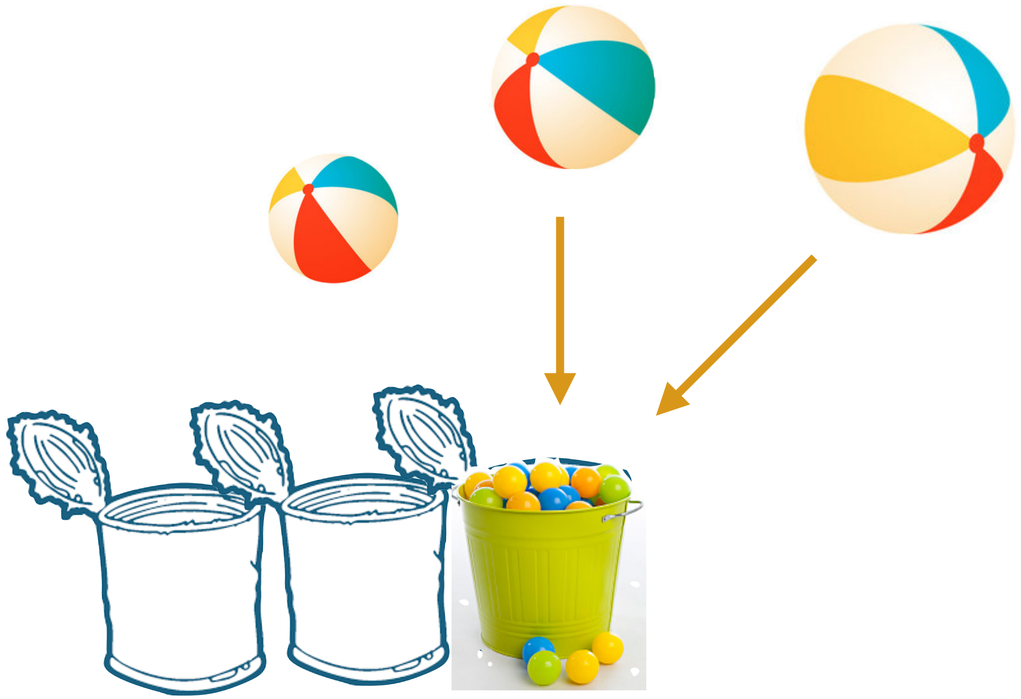
Concentration bounds:

$$Y = \sum_{i}^{n} Y_i \text{, where } Y_i \text{ are independent}$$

$$\mathbb{P}[\,|\,Y - \mathbb{E}[Y]\,|\,\geq M] \leq f(n, M)$$

The number of balls in each bin is negatively dependent.

Motivating Example: Balls-into-Bins



$$\mathbb{P}\left[\sum_{bin} \text{overflow}[bin] \geq 2\right] \leq ?$$

Not Independent!

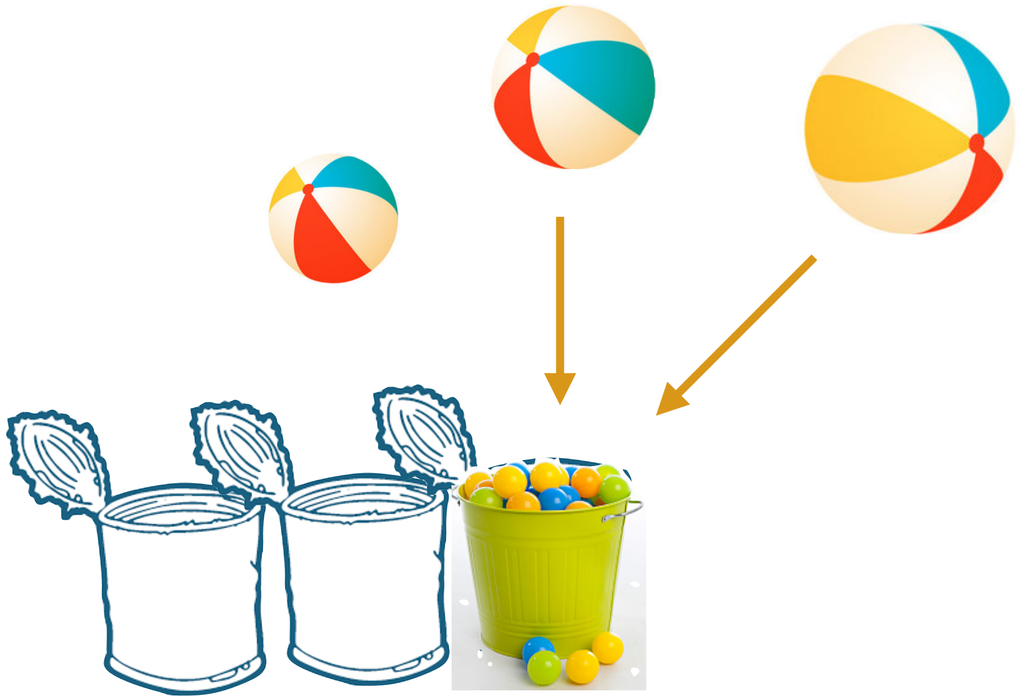
Concentration bounds:

$$Y = \sum_{i}^{n} Y_i \text{, where } Y_i \text{ are}$$ **negatively dependent**

$$\mathbb{P}[\,|\,Y - \mathbb{E}[Y]\,|\,\geq M] \leq f(n, M)$$

The number of balls in each bin is negatively dependent.

Motivating Example: Balls-into-Bins



$$\mathbb{P}\left[\sum_{bin} \text{overflow}[bin] \geq 2\right] \leq ?$$

Not Independent!

Concentration bounds:

$$Y = \sum_{i}^{n} Y_i \text{, where } Y_i \text{ are}$$ **negatively dependent**

$$\mathbb{P}[\,|\,Y - \mathbb{E}[Y]\,|\,\geq M] \leq f(n, M)$$

The number of balls in each bin is negatively dependent.

Our goal: Prove negative dependence formally.

Negative Dependence

Negative Dependence

Negative Covariance

Negative Regression

Negative Association (NA)

Negative Right Orthant Dependence

Negative Quadrant Dependence

Negative Association (NA) [Joag-Dev and Proschan 1983]

Definition

Real-valued random variables $X_1, \ldots, X_n$ satisfy NA **iff**

for any disjoint $Y, Z \subseteq \{X_1, \ldots, X_n\}$,

for any monotone functions $f : \mathbb{R}^{|Y|} \to \mathbb{R}_{\geq 0}$ and $g : \mathbb{R}^{|Z|} \to \mathbb{R}_{\geq 0}$,

$$\mathbb{E}[f(Y) \cdot g(Z)] \leq \mathbb{E}[f(Y)] \cdot \mathbb{E}[g(Z)] \ .$$

Lemma

Partition Negative Association (PNA) [Bao et al. 2022]

NA is a relation on a set of random variables.
PNA is a relation on a partition of random variables.

PNA satisfies similar closure properties as NA.

Lemma

$X_1, \ldots, X_n$ satisfies NA iff partition $\{X_1\}, \ldots, \{X_n\}$ satisfies PNA.

Semantics for ⊛

Semantics for $\circledast$

Let states be $\mathscr{D}$Mem.

Semantics for $\circledast$

Let states be $\mathscr{D}$Mem.

$\mu \in \mu_1 \otimes \mu_2$ iff μ is a joint distribution of μ_1, μ_2 and partition $\{\mathrm{dom}(\mu_1), \mathrm{dom}(\mu_2)\}$satisfies PNA in μ.

Semantics for $\circledast$

Let states be $\mathscr{D}$Mem.

$\mu \in \mu_1 \otimes \mu_2$ iff μ is a joint distribution of μ_1, μ_2 and partition $\{\mathrm{dom}(\mu_1), \mathrm{dom}(\mu_2)\}$satisfies PNA in μ.

$\mu \vDash P \circledast Q$ iff there exist μ_1, μ_2 such that $\mu_1 \vDash P, \mu_2 \vDash Q$, $\mu \in \mu_1 \otimes \mu_2$.

A Bunched Logic for NA [Bao et al. 2022]

A Bunched Logic for NA [Bao et al. 2022]

Theorem

$\mu \vDash \langle X_1 \rangle \circledast \langle X_2 \rangle \circledast \cdots \circledast \langle X_n \rangle$ **iff** $X_1, X_2, \ldots, X_n$ **are negatively associated in** μ**.**

A Bunched Logic for NA [Bao et al. 2022]

Theorem

$\mu \vDash \langle X_1 \rangle \circledast \langle X_2 \rangle \circledast \cdots \circledast \langle X_n \rangle$ **iff** $X_1, X_2, \ldots, X_n$ **are negatively associated in** μ**.**

Theorem

Properties of PNA can be encoded as valid axioms in our logic.

Our Contributions

Assertion Logic (with a sound and complete proof system)

Separating conjunction for asserting negative association

Program Logic (with a sound proof system)

LINA: a probabilistic Separation Logic for Independence and NA

Applications

Verify Bloom filter and other probabilistic data structures
